No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          sequence 2, Api

                                                                                                                                                                                                                                                                                       Sequence 2, Application US/09800960
Patent No. 6387677
GENERAL INFORMATION:
ATHER OF INVENTION: ISOLATED HUMAN KINASE PROTEINS, NUCLEIC
TITLE OF INVENTION: ACID MOLECULES ENCODING HUMAN KINASE PROTEINS, AND USES
TITLE OF INVENTION: THEREF
TITLE OF INVENTION: THEREF
CURRENT APPLICATION NUMBER: US/09/800,960
CURRENT FILING DATE: 2001-03-08
NUMBER OF SEQ ID NOS: 4
SOFTWARE: FASTSEQ for Windows Version 4.0
SEQ ID NO 2
LENGTH: 565
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       10;

HS272L16 by DNA linear PRI 23-NOV-1999 Undan DNA sequence from clone 272L16 on chromosome 1422.1-32.3. Contains the 3' end of the LAMB3 gene for Laminin, Beta 3 (Nicein, Ralinin, BM600) and a novel Rat Ca2+/Calmodulin dependent Protein

LOCUS DEFINITION

RESULT 8 HS272L16

```
272L16 is from the library RPCII constructed at the Roswell Park Cancer Institute by the group of Pieter de Jong. For further details see http://Dacpac.med.buffalo.edu/ VECTOR: pCYPAC2 This sequence was generated from a human chromosome 1 bacterial clone contig constructed in collaboration by the Sanger Centre chromosome 1 mapping group and Brian Schutte, Bryan Bjork, Kevin Coppage and Jeffrey Murray. Department of Pediatrics, University of Iowa, USA. Further information can be found at
                                                                                                                                                                                                                                                                                                                             Submitted (27-NOV-1998) Sanger Centre, Hinxton, Cambridgeshire, CB10 1SA, UK. on Dec 12, 1998 this sequence version replaced gi:3873472.
During sequence assembly data is compared from overlapping clones.
Where differences are found these are annotated as variations
together with a note of the overlapping clone name. Note that the
variation annotation may not be found in the sequence submission
corresponding to the overlapping clone, as we submit sequences with
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              only a small overlap as described above.

Hals sequence is the entire insert of clone 272L16. This sequence has been finished according to sequence map criteria as follows. An attempt is made to resolve all sequencing problems, such as compressions and repeats, but not necessarily within known annotated human repeat sequence elements (e.g. Alu). Where the sequence is ambiguous, there is an annotation using the 'unsure'
          genomic marker D1S491
                                                                                                                                                                                                             Euteleostomi;
Homo.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   5972. .6019

The invention relates to human nucleic acids (AAIS7798-AAI61369) and the encoded polypeptides (AAM38642-AAM42213) with nootropic, immunosuppressant and cytostatic activity. The polynucleotides are useful in gene therapy. A composition containing a polypeptide or polynucleotide of the invention may be used to treat diseases of the peripheral nervous system, such as peripheral nervous system diseases, such as localised neuropathies and central nervous system diseases, such as Alzheimer's, Parkinson's disease, Antinitor's disease, amyotrophic utilisation of the activities such as: Immune system suppression, Activinibin activity, chemotactic/chemokinetic activity, haemostatic and thrombolytic activity, arthritis and inflammation, leukaemias and

```
The invention relates to human nucleic acids (AAI57798-AAI61369) and the encoded polypeptides (AAM8642-AAM42213) with nootropic, immunosuppressant and cytostatic activity. The polymucleotides are useful in gene therapy. A composition containing a polypeptide or polynucleotide of the invention may be used to treat diseases of the peripheral nervous system, such as peripheral nervous injuries, peripheral nervous system diseases, such as localised neuropathies and central nervous system disease, such as alzheimer's, Parkinson's disease, Huntington's disease, amyotrophic localised neuropathies and central nervous system diseases, such as alzheimer's, Parkinson's disease, Huntington's disease, amyotrophic activity, chemoteactic/chemokinetic activity, haemostatic as infune system suppression, and thrombolytic activity, chemoteactic/chemokinetic activity, haemostatic and thrombolytic activity, arthritis and inflammation, leukaemias and c.N.S disorders.
                                                                                                                                                                                                                                                                              ä

The invention relates to a method for screening biologically active agent that modulates cancer associated protein kinase function. The invention also relates to a method for diagnosing cancer comprising determining the upregulation of expression of a nucleic acid sequence encoding a protein kinase. The method is useful for diagnosing cancer. A protein kinase is useful for screening biological agents that modulate cancer associated protein kinase function. Downrequlating the activity of protein kinase is useful for inhibiting the growth of a cancer cell, e.g. liver or colon cancer. A nucleic acid encoding protein kinase is useful for inhibiting the growth of a cancer cell, e.g. liver or colon cancer. A nucleic acid encoding protein kinase is useful to screen biopsy derived tumours and inflammatory samples such as arthritic synovium, for amplified DNA in the cell or increased expression of corresponding mRNA or protein and is also useful to detect differences in expression levels cancer as molecular weight, amino acid and nucleotide sequences between the two cells. The present sequence is human calmodulin kinase CAMK-XI gene
                                                                                                                                                                                                                                                                                     Human; cytostatic; antisense gene therapy; screening; protein kinase;

PT of a nucleic acid sequence encoding a protein kinase or upregulation of expression of the protein kinase, in the cancer.

TO f a nucleic acid sequence encoding a protein kinase or upregulation of expression of the protein kinase, in the cancer.

XX The invention relates to a method for screening biologically active agent that modulates cancer associated protein kinase function. The invention cancer associated protein kinase function of expression of a nucleic acid sequence encoding a protein kinase. The method is useful for diagnosing cancer. A protein kinase is useful for screening biological agents that modulate cancer associated protein kinase function. Downregulating the acid encoding protein kinase is useful for inhibiting the growth of a cancer cell, e.g. liver or colon cancer. A nucleic acid encoding protein kinase is useful to screen biopsy derived tumours and inflammatory samples such as arthritic synovium. For amplified DNA in the call or increased expression of corresponding mRNA corporated and is also useful to detect differences in expression levels cuch as molecular weight, amino acid and nucleotide sequences between the corporated on chromosome 1932.1-32.3.

The Invention Teatures to numen nucrear actus, containing the encoded polypeptides (AAM38642-AAM4213) with nootropic, immunosuppressant and cytostatic activity. The polynucleotides are useful in gene therapy. A composition containing a polypeptide or polynucleotide of the invention may be used to treat diseases of the peripheral nervous system, such as peripheral nervous injuries, peripheral nervous system diseases, auch as Alzhaimer's, Parkinson's disease, Huntington's disease, amyotrophic lateral sclerosis, and Shy-Drager Syndrome. Other uses include the utilisation of the activities such as: Immune system suppression, activity, chemotexic/chemokinetic activity, haemostatic and thrombolytic activity, chemotexic/chemokinetic activity, haemostatic assays for receptor activity, arthritis and inflammation, leukaemias and constitutions. The sequence data for this patent did not form part of the printed
                                                                                                                                                                                                                                                                                     ä
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     246

                                                                                                                                                                                                                              the encoded polypeptides (AAAA2113) with nootropic, immunosuppressant and cytostatic activity. The polynucleotides are useful immunosuppressant and cytostatic activity. The polynucleotides are useful in gene therapy. A composition containing a polypeptide or polynucleotide of the invention may be used to treat diseases of the peripheral nervous system, such as peripheral nervous injuries, peripheral nervous system diseases, such as Alzheimer's, Parkinson's disease, Huntington's disease, amyotrophic lateral sclerosis, and Shy-Drager Syndrome. Other uses include the laterial for the activities such as: Immune system suppression, Activin/inhibin activity, chemotactic/chemokinetic activity, haemostatic and thrombolytic activity, cencer diagnosis and therapy, drug screening,

The invention relates to polynucleotides (I) encoding diagnostic and therapeutic (DITHP) polypeptides (II), which include e.g. enzymes, conditionally provided in growth and development and receptors. (I) and and proteins involved in growth and development and receptors. (I) and associated with inappropriate DITHP expression. For example, (I) and consider the activity of the DITHPS, by expressing inactive proteins cappelementing the patient's own production of them. (I) and (II) may be used to treat diseases, for example, call proliferative proteins consupplementing the patient's own production of them. (I) and (II) may be used to treat diseases, for example, call proliferative disorder, crohn's disease, acquired immune deficiency syndrome (AIDS), lymphoma, continually and culturing the DITHPS, by inscrting the nucleic acids into a host call and culturing the cell to express the protein. (I) and its complementary sequences may also be used as DNA probes in diagnostic assays to detect and quantitate the presence of similar nucleic acids in camples, and therefore which patients may be in need of restorative capped antibodies and activity. The anti-DITHP actibodies and antibodies may also be used as adiagnostic agents for detecting the capped or produce of DITHPP in samples, or antibodies may also be used as diagnostic agents for detecting the capped or presence of DITHPP in samples, or assay (EILSA), has samples, e.g. by enzyme linked immunosorbant capped to the patient of the patient
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           31;

The polypeptide is useful for treating diseases such as nervous disease, arrhythmia, tumour and growth development disturbance disease. The present sequence represents the human CaM kinase I 39.05 polypeptide encoding cDNA.

The present invention relates to human kinases (PKIN) and the nucleic acids encoding them. PKIN is used as vaccine and in gene therapy. PKIN is used in the prevention, diagnosis and treatment of diseases cancers, acid in the prevention, diagnosis and treatment of diseases cancers, adenocarcinoma, leukaemia, sarcoma, immune disorder, Addison's disease, acquired immune deficiency syndrome (AIDS), anaemia, asthma, allergies, gout, microbial infections, cardiovascular disease and/or inflammation, myasthenia gravia, atherosclerosis, cirrhosis, osteoporosis, myocardial infarction, cataract, growth and development disorder, seizure disorder, infancation, cataract, growth and development disorder, injud storage infarction, cataract, growth and development disorder, seizure disorder, capumonary embolism, daucher's disease, renal disease and obesity. FKIN may be used to treat disorders associated with decreased PKIN expression by rectifying mutations or deletions in a patient's genome that affect the activity of PKIN by expressing inactive proteins or to cupplement the patients own production of PKIN. PKIN nucleic acids may be used to produce the PKIN polypeptide, by inserting the nucleic acids into a host cell and culturing the cell to express the protein. PKIN nucleic acid and its complementary sequences may also be used as DNA probes in caid and its complementary sequences may also be used as DNA probes in nucleic acid sequences in samples and therefore which patients may be nown.
seizure disorder; pulmonary embolism; Gaucher's disease; lipid disorder; lipid storage disease; Pick's disease; Tay-Sachs disease; renal disease; obesity; restorative therapy; immunomodulatory; vaccine; cardiovascular; antimicrobial; cytostatic; antiinflammatory; asthma; ss.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Yao MG;
